The website I have implemented represents a brochure for the TV series "Friends". The website contains information regarding the creation of the show, description of the characters, pictures with the characters, interesting facts and a page that is dedicated to some awards the show has received. In terms of the information architecture, I have used a flat structure. The reason behind this choice is to make sure that the user can easily access each page and get the information needed. In addition, the names of the options inside the navigation bar describe exactly what information are presented on the that webpage.

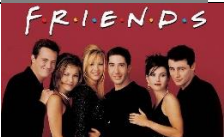

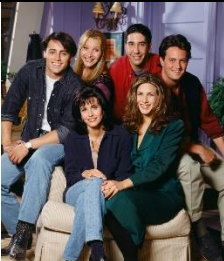

The structure I have implemented helps in creating an intuitive design that helps the user to efficiently use the website. Another design feature I have added in order to build an intuitive website is regarding the navigation bar. The name of the page the user is on changes the background that also matches with the picture inside the header.

Each html page contains the head and body sections, the body is structured in three sections: header, main and footer. The header contains the navigation bar and the picture with friends; therefore it is inside all the html pages, the only change encountered is the location of the class="active" because it has to match the page that is active, inside the nav element. The home page, index.html, contains a class, called "container", that incorporates the two aside elements and the section. For the first aside to be located on the left of the section, I decided to include the code for it before the code for the section inside the html, and the then I added the code for the other aside, because HTML takes into consideration the order in which the elements were added. In addition, the <main> element, which is a flex container, has a width of 100% that incorporates the asides and the section, the aside has 20% and the section 60%, therefore all the elements fit in one frame and start from the same line. In terms of the design, the text inside the asides and the about section is aligned to left, while the title "About" is centered. The iframe below the "about" text has a width of 100%, therefore it is centered. On the next page, "characters.html", the <nav> element, as well as the picture remain the same. The title is centered, has a width of 100% and is outside of the class "container" in order for it to be the only element on that line, however it is still part of the class called "characterMain" so it respects the paddings the other elements have, padding-left: 20%, padding-right: 20%. This layout helps the user to read faster, however it also helps in creating a more compact design. The <main> element contains, apart from the title, multiple sections that provide information regarding the main characters of "Friends". A section includes an <aside> element and another section with a paragraph. Given the layout of the page, there are two types of asides, depending on the order, therefore the asides inside class "picturesLeft" have the text aligned to the left, while the other ones have the text aligned to the right. The text also has a padding-top for the text to start from the line where the picture starts. The paragraphs are all part of the same class "textCharacters" because each paragraph is aligned to the left. Each one of the sections that contain the <aside> element, along with the <p> element are inside the class "container". Therefore, each one of these sections has display type flex and the width is 100% for the layout to be more organized. The "photos.html" page contains the <nav> element and the picture inside the header, while inside main it contains multiple pictures with different scenes from the TV serial "Friends" and a section heading that is inside class "title", so it has the same styling characteristics as the other titles. For a better layout, the pictures are inside a table, each picture has the same width and height, the table has a display type flex and is centered. The "facts.html" page, apart from the elements in the header and the title that are commonly used on every other page, contains one section classed "facts" that incorporates multiple sections each one of them classed as "container". The class "facts" is the class of the main section because the styling attributes it has are used by all the other sections, the left and right paddings are 25% each so the content is in the center of the page, therefore the section's width is using only 50% of the page. The reason why the section headings and the paragraphs are not part of the same section is because I wanted those two elements to be on different lines, so the paragraph is under the title, therefore the class container has a width that is 100%. The "awards.html", inside the <main> element, contains a table that also has headings in comparison to the other tables. The table is styled in order to stay in the center of the image. In order to create a responsive layout, I have mainly used "em" and percentages as unit elements throughout the website.

In consideration to the adaptability of the website for different screen sizes I have included media queries to target styling for different screen sizes and orientations. Therefore, I have included three media queries, one for laptops, therefore the orientation is landscape, and the width is 1920px minimum. While for tablets, there are two media queries, one that has the orientation landscape and the other one that has the orientation portrait. Both media queries have the medium width equal to 800px. For the page to look similar while using a tablet to how it would look like on a laptop/computer, I have changed some styling attributes, such as the padding- top inside the class "textCharacters" has been increased from 3em to 5em, the last column inside the table on the "photos.html" is inside the class "hide" that hides those pictures. However, the last changed is only occurring when the screen is in portrait mode.

From a critical perspective, the website has some issues in terms of the adaptability of "photos.html" in portrait mode because the content does not use 100% of the width of the page although I have tried solving this problem by hiding the last column of pictures. Also, the "facts.html" hides a part of the character's name. These issues might damage the usability of the site.
